Division of Land Economics
Lincoln, Nebraska
June, 1946

TRENDS IN INLAND USE AND CROP PRODUCTION
SUN RIVER IRRIGATION PROJECT, MONTANA
1910-44 1/

This report shows trends in land use and crop production on the Sun River Irrigation Project in Lewis and Clark, Teton and Cascade counties, Montana, from 1910 to 1944. No analysis is made of the reasons for the various trends shown. Data for this report are from the Annual Project Histories and Annual Reports of the Bureau of Reclamation. The data are based on the crop census taken every year.

Definition of Terms

The principal terms used in this report follow as closely as possible the current reporting terminology of the Bureau of Reclamation. These terms are defined as follows:

"Irrigable acreage" is that acreage for which the Bureau of Reclamation was prepared to supply water.

"Net area in cultivation" is all irrigable land from which crops were harvested, land in soil improvement crops, fallow or fall plowed land, and land irrigated for pasture. It sometimes includes cropland that was not irrigated during that crop year.

"Cereal grains" include barley, corn, oats, rye, wheat, sorghum for grain and speltz.

"Hay and forage crops" include alfalfa hay, clover hay, corn fodder, pasture, sorghum, mangels, ensilage and grain straw.

"Other crops" include seed, garden, truck and fruit.

1/ This report was prepared by Earl F. Hodges and Lawrence A. Reuss Harry A. Schmitt, formerly with the Bureau of Agricultural Economics, assisted in the compilation of the data.

The study upon which this report is based was started in 1944 and was continued under a Memorandum of Agreement between the Bureau of Agricultural Economics, United States Department of Agriculture, and the Bureau of Reclamation, United States Department of Interior, effective November 1945.

"Gross value of crops" includes the value of forage, irrigated pasture, harvested crops, government and commercial payments.

Sugar beet tops and flax straw are included with the value of "Hay and forage"

Agricultural Conservation payments other than sugar beet payments are included in the value of "Other crops"

The value of sugar beets in a given year is the initial factory payment for that year plus agricultural Conservation and factory bonus payments received for beets grown in the previous crop year. For this reason the gross value of beets and the price per ton do not accurately reflect the returns received for the crop produced in any given year.

It should be noted that crop yield data combine irrigated and nonirrigated crop yields. Sugar beets, alfalfa and similar crops having high water requirements are usually irrigated whereas in some years small grains may be grown without irrigation.

(Data not available prior to 1937)

1/ Acreage for which Bureau of Reclamation was prepared to supply water.
 2/ Harvested crops plus pasture.
 3/ Land from which no crop was harvested such as fallow and hail-damaged crops.
 4/ Temporarily suspended from the acreage upon which water charges are levied.
 5/ Less than 500 acres.
 6/ Estimated.
 7/ Data not available.

1/ Net area in cultivation includes all land from which crops were harvested, fallow or fall plowed land, and land irrigated for pasture. It may include cropland that was not irrigated during the crop year.

2/ For example, in 1944 this item is composed of 4,799 acres seed peas, 4,025 acres flax, 7,697 acres fallow, 1,746 acres soil building crops, and 3,214 acres of miscellaneous crops.

3/ Less than 500 acres.

1/ Government conservation program payments were divided between "Sugar beets" and "Other crops". The value of sugar beet tops is included with "Hay and forage" crops. Agricultural conservation and factory bonuses were credited to the year in which payments were received.
 2/ Such as seed, gardens, truck, fruit.
 3/ Less than 500 acres.
